

The background of the slide features a large, faint, circular seal of the University of Gothenburg. The seal contains a central figure holding a sword and a book, surrounded by Latin text: "SIGILLVM • VNIVERSITATIS • GOTHORVM • CAROLINÆ • AD • VT • RVMQVE" and the year "1666".

Friday Seminar

Martin Karlsson

The Department of Automatic Control
April 24, 2015

Introduction

- Here since one year
- Supervisors: Rolf Johansson and Anders Robertsson
- ENGROSS - Robot positioning
- SARAFun - Integrate assembly tasks on YuMi (FRIDA)

ENGROSS

- Funding: Stiftelsen för Strategisk Forskning (SSF)
- Cooperation between CS, Maths and us
- <http://www.control.lth.se/Research/Robotics/engross.html>
- IMU-aided visual odometry
- Experiment - positioning of the end-effector of a robot arm
- Carried out together with Mårten Wadenbäck,
Mathematical Imaging Group

ENGROSS

Camera calibration

Distorted "fish-eye" images due to the lens are common and must be compensated for.

Camera calibration

Undistortion - example

Camera calibration

Undistortion - example

Visual Odometry (VO)

- Navigation by integration of local motion estimates from cameras
- Track movement of feature points, e.g. SURF- or SIFT-points:

Visual Odometry (VO)

Use SURF-points and RANSAC to estimate homographies.

$$P_A = R_{\psi\theta}[I|0]$$

$$P_B = R_{\psi\theta}R_\phi[I| -t]$$

The homography H between these is

$$H = \lambda R_{\psi\theta}R_\phi T R_{\psi\theta}^T$$

- The tilt can be estimated by an iterative scheme
- In our case, the true tilt is constant.
- When the tilt is estimated, the translation and ϕ can be reconstructed.

Experiment

- Positioning of the end-effector of IRB140
- Images from the camera and data from the IMU
- Position data from the robot serves as ground truth. This is why we used a robot arm, and not a mobile robot.

Results

Estimated tilt:

$$\hat{\theta} = 42.2^\circ$$

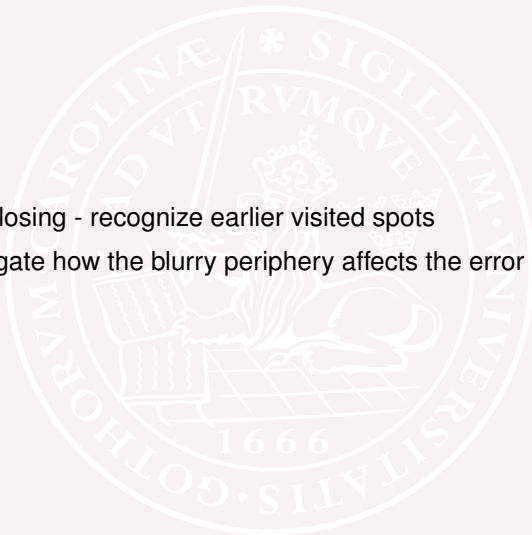

$$\hat{\psi} = 6.2^\circ$$

Duration: 60 seconds

ENGROSS - Future work

- Loop closing - recognize earlier visited spots
- Investigate how the blurry periphery affects the error

SARAFun

- **S**mart **A**ssembly **R**obot with **A**dvanced **FUN**ctionalities
- Continuation of ROSETTA
- Develop a framework for instruction of assembly tasks
- Goal: A non-expert user should be able to teach a new assembly task on YuMi in less than one day

SARAFun

- Idea: Equip the robot with sensors, and demonstrate the task
- Contact force estimation
- Vision
- Audio recognition

YuMi hanging out with Merkel

Audio recognition

- Idea: Use a pattern recognition algorithm to recognize important sounds, that e.g. indicate completion of an assembly subtask
- TBD: Use a matched filter to optimize SNR
